

NVDA Daily Quant Research

2026-05-12

NVDA delayed research data for 2026-05-12: 6 signal modules evaluated; session return +1.07%.

Educational research output only. Not financial advice.

Momentum Confluence: BULLISH (62%)

RSI 57.65 and MACD histogram 0.3402. Momentum is evaluated as confluence against recent price and volume.

MACD and StochRSI are confluence inputs only, not standalone edge claims. Recent technical-rule evidence is mixed.

Opening Range Breakout: NEUTRAL (38%)

Opening proxy range 217.01 to 223.75. Requires stocks-in-play, stop, target, and slippage assumptions.

ORB must be filtered by RVOL and compared with buy-and-hold. No personalized financial advice.

Daily High/Low and Fib Map: BULLISH (52%)

Session high 223.75, low 215.01. Fib 61.8% 220.41.

Fib levels are references, not proof of support or resistance. Daily highs/lows require market-structure context.

FVG / Imbalance Zones: NEUTRAL (48%)

6 three-candle imbalance zones detected. Zones are tracked for fill status and invalidation in the UI model.

ICT/FVG is treated as a testable imbalance zone, not doctrine. Volume confirmation is required.

Buy-and-Hold Baseline: BULLISH (55%)

Session buy-and-hold return +1.07%. All tactical reads are compared against this baseline.

Baseline ignores taxes, borrowing costs, and overnight risk. Costs and slippage can dominate intraday edges.

Profitable-Company Dip Proxy: BULLISH (42%)

Latest close 220.87 versus prior 220.7. Quality/profitability requires separate fundamental data.

This is a dip-versus-strength comparison only. Gamma-neutral market-maker behavior is proxied from options data.
